About SandRidge Energy

SandRidge Energy operates Produced Water pipelines in Oklahoma. These pipelines transport produced water from oil and gas reservoirs into underground porous rock formations not productive of oil or gas, and sealed above and below by unbroken, impermeable strata.

Products Transported and Counties Involved

Product	Description	Description	Counties Involved
Produced Water	<p><u>Leak:</u> Liquid</p> <p><u>Vapor:</u> Lighter than air.</p>	Produced water is a salt water byproduct of geologic formations that produce oil and gas. Produced water comes up simultaneously with the production of oil and gas. Small quantities of substances used in the drilling, completion and production operations of a well may be mixed in the produced water's waste stream. Some of these materials include; minor amounts of drilling mud, fracture fluids and well treatment fluids, and small amounts of residual hydrocarbons.	Alfalfa Garfield Grant Woods
